

# Learning Brains

Integrated On-the-Job Learning Systems for Industrial Reskilling

## AI Tools Analysis Report

Evaluation of AI Tools for On-the-Job Training

Erasmus+ Programme | 2025-1-ES01-KA220-VET-000351934  
June 2026

*This project has been funded with support from the European Commission. This publication reflects the views only of the authors, and the Commission cannot be held responsible for any use which may be made of the information contained therein.*

## Executive Summary

---

This report provides a structured evaluation of 15 AI-powered tools assessed for their potential use in on-the-job training within industrial and vocational education contexts, as part of the Learning Brains project under the Erasmus+ Programme.

The tools have been categorised across a range of functional types including Learning Management Systems (LMS/LXP), VR/AR training platforms, AI-powered content authoring tools, chatbot and workflow automation platforms, and specialist analytics solutions. Each tool has been evaluated on the basis of its core functionalities, strengths and limitations, technical integration requirements, language support, and suitability for industrial reskilling contexts.

Key findings include: (1) Augmentir stands out as the most comprehensive AI-native connected worker platform for industrial environments; (2) TalentLMS and Docebo are the strongest general-purpose LMS solutions with solid AI integration; (3) AutoVRse, AIDAR Solutions, and 3spin Learning offer compelling immersive VR/AR training for manufacturing and safety contexts; (4) FlowHunt and NotebookLM are best used as complementary tools to augment existing training infrastructure rather than as standalone platforms; (5) Napkin AI and Uizard, while not training platforms per se, offer high value for the rapid creation of visual learning materials and design skill development respectively.

The report concludes with a comparative overview matrix to support decision-makers in selecting the most appropriate AI tool combinations for their specific industrial training needs.

## Introduction

---

The rapid evolution of artificial intelligence is transforming how organisations deliver training and develop workforce competencies. Within industrial and vocational education contexts — where hands-on skills, safety compliance, and continuous upskilling are critical — AI-powered tools offer new opportunities to personalise learning, scale training delivery, and reduce the time to competence for frontline workers.

The Learning Brains project, funded under the Erasmus+ Programme (2025-1-ES01-KA220-VET-000351934), aims to develop and pilot integrated on-the-job learning systems for industrial reskilling across partner countries. As part of this effort, this report presents a detailed analysis of 15 AI tools that have been identified as relevant to the project's objectives.

Tools were selected to represent the breadth of the current AI training landscape, from established LMS platforms with AI features to emerging VR/AR simulation environments, workflow automation assistants, and visual content creation tools. Each tool has been assessed by project partners using a standardised factsheet methodology, ensuring consistency of evaluation across the full portfolio.

# Tool-by-Tool Analysis

The following sections present a detailed analysis of each of the 15 AI tools evaluated in this report. Each analysis follows a consistent structure: tool overview, key strengths and weaknesses, technical information, and an overall suitability assessment for industrial on-the-job training contexts.

## 1. TalentLMS

| Vendor / Developer              | Country | Website                                                             | Last Update          |
|---------------------------------|---------|---------------------------------------------------------------------|----------------------|
| Epignosis Learning Technologies | USA     | <a href="https://www.talentlms.com/">https://www.talentlms.com/</a> | January 2026 (V6.13) |

**Tool Categories:** Content generation | Analytics / Prediction | LMS/LXP with AI

**Fields of Use:** HR | IT | Corporate Training / E-learning

### Description

TalentLMS is a cloud-based learning management system for corporate training and e-learning. It allows organisations to create, deliver, and track online courses efficiently, with AI-powered features such as course translation, AI Coach, and skills tracking.

| Key Strengths                                                                                                                                                                                                                                                                                                                                                           | Weaknesses / Limitations                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>• Easy-to-use cloud platform with minimal setup requirements</li><li>• AI-powered tools for course creation, translation, and personalised learning paths</li><li>• Extensive integrations with HR, CRM, and collaboration tools (Zoom, Teams)</li><li>• Advanced reporting and analytics for tracking learner progress</li></ul> | <ul style="list-style-type: none"><li>• AI features may not fully replace human instructional design</li><li>• Customisation options can be limited in lower-tier plans</li><li>• Some advanced integrations require technical knowledge or additional setup</li><li>• Offline learning features are limited compared to fully on-premise LMS</li></ul> |

### Technical Information

|                    |                                                                                |
|--------------------|--------------------------------------------------------------------------------|
| <b>Integration</b> | Cloud-based LMS with SSO (SAML 2.0, Okta, Google, LDAP), extensive API, Zapier |
| <b>Languages</b>   | 40+ languages with AI-powered translation                                      |

### Suitability Assessment

*Best suited for organisations seeking a scalable, easy-to-deploy LMS with solid AI-assisted content creation and multilingual support. Ideal for HR and L&D teams without heavy technical resources.*

## 2. TalentCards

| Vendor / Developer | Country                 | Website                                                         | Last Update             |
|--------------------|-------------------------|-----------------------------------------------------------------|-------------------------|
| Epignosis          | USA (origins in Greece) | <a href="https://talentcards.com/">https://talentcards.com/</a> | Continuous (cloud SaaS) |

**Tool Categories:** Mobile microlearning platform (flashcard-based)

**Fields of Use:** HR | Production | Maintenance | Quality | HSE | Soft Skills | IT | Marketing

### Description

TalentCards is a mobile-first microlearning platform that delivers short training lessons as digital flashcards. Bite-sized lessons include text, images, videos, and quizzes delivered through a smartphone app — making training accessible for deskless and frontline workers.

| Key Strengths                                                                                                                                                                                                                                                                                                                                                                                                                              | Weaknesses / Limitations                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>• Mobile microlearning in short, easy-to-consume card formats</li> <li>• AI content creation: auto-generates training cards, images, and quizzes from a topic</li> <li>• Gamification features (points, leaderboards) to boost engagement</li> <li>• Spaced repetition improves knowledge retention</li> <li>• Offline access — content can be downloaded and completed without internet</li> </ul> | <ul style="list-style-type: none"> <li>• Flashcard structure is not suitable for complex or long courses</li> <li>• Basic reporting and analytics compared to enterprise LMS platforms</li> <li>• Restricted to simple quiz types (e.g., multiple choice)</li> <li>• Managing extensive training programmes with many learning paths can be challenging</li> </ul> |

### Technical Information

|                    |                                                                         |
|--------------------|-------------------------------------------------------------------------|
| <b>Integration</b> | Integrates with TalentLMS; public API; Zapier; SSO on higher-tier plans |
| <b>Languages</b>   | EN, ES, IT, DE, PT, FR, NL, SK, AR, JA, KO, TR, RU, SV, and more        |

### Suitability Assessment

*Excellent for frontline and deskless worker training where quick, mobile-accessible micro-lessons are needed. Particularly effective for compliance, onboarding, and safety briefings in industrial settings.*

### 3. iSpring AI

| Vendor / Developer     | Country | Website                                                                           | Last Update                    |
|------------------------|---------|-----------------------------------------------------------------------------------|--------------------------------|
| iSpring Solutions Inc. | USA     | <a href="https://www.ispringsolutions.com/">https://www.ispringsolutions.com/</a> | 2025 (AI functions introduced) |

**Tool Categories:** Content generation | Chatbot/Assistant | AI-assisted course authoring

**Fields of Use:** HR | Quality | HSE | Soft Skills | IT | General eLearning

#### Description

iSpring Suite AI is an AI-powered course authoring tool that assists in creating eLearning content quickly and efficiently. It can generate text, quizzes, images, and translations, helping instructional designers streamline course production, with full compatibility with SCORM and xAPI standards.

| Key Strengths                                                                                                                                                                                                                                                           | Weaknesses / Limitations                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>• Rapid content creation for courses, quizzes, and visuals</li> <li>• AI-assisted translations and localisation in 50+ languages</li> <li>• Seamless integration with existing PowerPoint workflows and LMS platforms</li> </ul> | <ul style="list-style-type: none"> <li>• Does not provide adaptive learning or personalised student feedback</li> <li>• Lacks conversational chatbot functionality for learners</li> <li>• Analytics and performance prediction are not AI-driven — focus is on content, not assessment</li> </ul> |

#### Technical Information

|                    |                                                                                     |
|--------------------|-------------------------------------------------------------------------------------|
| <b>Integration</b> | Integrates with iSpring Learn LMS and SCORM/xAPI-compliant platforms; API available |
| <b>Languages</b>   | 50+ languages including EN, ES, IT, DE, SK, PT, FR, ZH, JA                          |

#### Suitability Assessment

*Ideal for instructional designers and L&D teams that already use PowerPoint and need to rapidly produce multilingual eLearning content. Not recommended where adaptive learning or learner analytics are priorities.*

## 4. AIDAR Solutions

| Vendor / Developer | Country | Website                                                               | Last Update   |
|--------------------|---------|-----------------------------------------------------------------------|---------------|
| Aidar              | Poland  | <a href="https://aidarsolutions.com/">https://aidarsolutions.com/</a> | Not specified |

**Tool Categories:** Adaptive learning | VR/AR Training

**Fields of Use:** Production | Maintenance | HSE

### Description

AIDAR Solutions (Aidar.Skills) offers tailor-made VR/AR industrial training and remote consultation. A comprehensive 3D knowledge base ensures process continuity and knowledge retention regardless of employee rotation, with no coding knowledge required.

| Key Strengths                                                                                                                                                                                                                                                                                                             | Weaknesses / Limitations                                                                                                                                                                                                                                             |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>Hardware-agnostic — independent of specific VR/AR headset vendors</li> <li>Easy integration with Industrial IoT (IIoT) systems</li> <li>No-code: training courses can be created and edited by customers</li> <li>Supports remote consultation alongside VR/AR training</li> </ul> | <ul style="list-style-type: none"> <li>Pricing information not publicly available, likely a barrier for smaller organisations</li> <li>Factsheet data is limited — feature depth is not fully documented</li> <li>Language support details are incomplete</li> </ul> |

### Technical Information

|                    |                                                   |
|--------------------|---------------------------------------------------|
| <b>Integration</b> | Can be integrated with any Industrial IoT systems |
| <b>Languages</b>   | EN, DE, PL and likely more                        |

### Suitability Assessment

*Well-suited for industrial environments (manufacturing, maintenance, safety) that require immersive, hardware-agnostic VR/AR training with IIoT connectivity. Best for medium-to-large industrial companies.*

## 5. Uizard

| Vendor / Developer                                                                | Country | Website                                             | Last Update |
|-----------------------------------------------------------------------------------|---------|-----------------------------------------------------|-------------|
| Tony Beltramelli,<br>Henrik Haugbølle,<br>Ioannis Sintos, Florian<br>van Schreven | Denmark | <a href="https://uizard.io/">https://uizard.io/</a> | 2025        |

**Tool Categories:** Content generation | Adaptive learning | Interactive Design Training

**Fields of Use:** HR | Soft Skills | IT | Marketing | Interactive Design Training

### Description

Uizard is an AI-powered design platform that enables employees to learn UI/UX design by creating real projects in a hands-on environment. AI suggestions adapt to user input during wireframing, prototyping, and interactive interface creation.

| Key Strengths                                                                                                                                                                                                                                                                                               | Weaknesses / Limitations                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>Hands-on, project-based learning directly on the job</li> <li>AI-guided suggestions that adapt to user actions in real time</li> <li>Supports rapid skill acquisition in UI/UX and digital design</li> <li>No prior technical expertise required to start</li> </ul> | <ul style="list-style-type: none"> <li>Focused exclusively on design-related skills — not a general training platform</li> <li>Limited formal assessment or feedback mechanisms</li> <li>Not a full LMS or structured course platform</li> <li>Advanced features may have a learning curve for new users</li> </ul> |

### Technical Information

|                    |                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Integration</b> | API integrations; can be embedded into websites or internal systems; limited native LMS/LXP support |
| <b>Languages</b>   | EN, SK, ES, DE, IT, PT, and others depending on AI model                                            |

### Suitability Assessment

*Best suited for IT, marketing, and design teams that want practical, on-the-job UI/UX skill development. Not appropriate as a standalone training system for industrial or compliance contexts.*

## 6. Disco

| Vendor / Developer              | Country | Website                                                   | Last Update   |
|---------------------------------|---------|-----------------------------------------------------------|---------------|
| Candice Faktor & Chris Sukornyk | Canada  | <a href="https://www.disco.co/">https://www.disco.co/</a> | December 2025 |

**Tool Categories:** Content generation | Adaptive learning | Analytics / Prediction | LMS/LXP with AI

**Fields of Use:** HR | IT | Learning & Development | Community Engagement

### Description

Disco is an AI-powered learning and community platform that combines course management, cohort-based learning, and community engagement in a single platform. AI assists with content generation, personalised learning paths, and automated workflows, alongside analytics to track learner progress.

| Key Strengths                                                                                                                                                                                                                                                                                                             | Weaknesses / Limitations                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>AI-assisted content creation and personalised learning paths</li> <li>Integration of learning and community engagement in one platform</li> <li>Advanced analytics for tracking progress and engagement</li> <li>Flexible for both self-paced and cohort-based learning</li> </ul> | <ul style="list-style-type: none"> <li>AI personalisation may not fully replace human instructional design</li> <li>Advanced features may require subscription and technical setup</li> <li>Limited offline learning capabilities</li> <li>Platform is primarily optimised for English content</li> </ul> |

### Technical Information

|                    |                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------|
| <b>Integration</b> | Cloud-based LMS/LXP with SSO (OAuth, SAML), API access, Slack, Zoom, Teams, Google Workspace |
| <b>Languages</b>   | Primary interface in EN; multi-language content supported; AI-assisted translation available |

### Suitability Assessment

*Suitable for professional learning communities, cohort programmes, and knowledge-sharing organisations. Less suited to industrial or frontline worker training due to limited offline support.*

## 7. Augmentir

| Vendor / Developer | Country | Website                                                             | Last Update   |
|--------------------|---------|---------------------------------------------------------------------|---------------|
| Augmentir, Inc.    | USA     | <a href="https://www.augmentir.com/">https://www.augmentir.com/</a> | February 2026 |

**Tool Categories:** Content generation | Adaptive learning | Chatbot/Assistant | Analytics / Prediction | Assessment / Feedback | VR/AR Training

**Fields of Use:** HR | Production | Maintenance | Quality

### Description

Augmentir is an AI-native connected worker platform designed for industrial environments including manufacturing, field service, operations, maintenance, and quality. It digitises and optimises the entire frontline worker lifecycle — from onboarding and training to real-time task support and continuous improvement — using Generative AI (Augie) and no-code industrial AI agents.

| Key Strengths                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Weaknesses / Limitations                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>Combines Generative AI and Agentic AI for autonomous, context-aware frontline support</li> <li>Supports immersive AR guidance and real-time expert collaboration</li> <li>Covers the full worker lifecycle: training, safety, inspections, quality, operations, onboarding</li> <li>No-code builder allows companies to create their own industrial AI agents without development expertise</li> <li>Converts Word, Excel, PDFs, images, and videos into smart checklists, SOPs, and work instructions</li> </ul> | <ul style="list-style-type: none"> <li>AI and collaboration features require internet connectivity (limited offline mode)</li> <li>Rich feature set may require change management for organisations new to connected-worker systems</li> <li>Enterprise system integrations may require IT involvement</li> </ul> |

### Technical Information

|                    |                                                                       |
|--------------------|-----------------------------------------------------------------------|
| <b>Integration</b> | Integrates with ERP, CMMS, QMS, MES, LMS, CRM via connectors and APIs |
| <b>Languages</b>   | Not specified in factsheet                                            |

### Suitability Assessment

*Highly recommended for manufacturing, maintenance, and field service organisations seeking a comprehensive, AI-powered connected worker platform. One of the most complete industrial training solutions in this report.*

## 8. FlowHunt

| Vendor / Developer         | Country  | Website                                                         | Last Update |
|----------------------------|----------|-----------------------------------------------------------------|-------------|
| QualityUnit – Viktor Zeman | Slovakia | <a href="https://www.flowhunt.io/">https://www.flowhunt.io/</a> | Fall 2025   |

**Tool Categories:** Content generation | Adaptive learning | Chatbot/Assistant | AI workflow automation / AI agents platform

**Fields of Use:** HR | Maintenance | Quality | HSE | Soft Skills | IT | Marketing | Customer Support / Knowledge Management

### Description

FlowHunt is an AI-powered platform for building custom chatbots, AI agents, and automated workflows without extensive coding. It integrates large language models with custom data sources for content generation, Q&A, and business process automation. A visual builder makes it accessible to both technical and non-technical users.

| Key Strengths                                                                                                                                                                                                                                                                                                                                | Weaknesses / Limitations                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>User-friendly visual workflow builder accessible to non-technical users</li> <li>Strong integration of AI models with custom knowledge bases</li> <li>Flexible use cases: chatbots, automation, content generation</li> <li>No-code/low-code approach suitable for businesses of all sizes</li> </ul> | <ul style="list-style-type: none"> <li>Not a dedicated LMS — lacks built-in course management features</li> <li>Limited built-in analytics and performance tracking</li> <li>Requires initial setup and understanding of workflows</li> <li>Advanced use cases may still require technical knowledge</li> </ul> |

### Technical Information

|                    |                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Integration</b> | API integrations with external tools; Slack; embeddable into websites/internal systems; limited native LMS/LXP support |
| <b>Languages</b>   | EN, SK, ES, DE, IT, PT, and others depending on AI model                                                               |

### Suitability Assessment

*Excellent for organisations looking to build internal AI knowledge bases, automated onboarding chatbots, or custom training Q&A assistants. Not a standalone LMS but a strong complement to existing training infrastructure.*

## 9. NotebookLM

| Vendor / Developer | Country       | Website                                                             | Last Update |
|--------------------|---------------|---------------------------------------------------------------------|-------------|
| Google             | United States | <a href="https://notebooklm.google/">https://notebooklm.google/</a> | 2026        |

**Tool Categories:** Content generation | Adaptive learning | LMS/LXP with AI

**Fields of Use:** Soft Skills | Marketing

### Description

NotebookLM (previously NotebookKLM) is an AI-powered research and note-taking tool by Google. Acting as a 'smart notebook', it analyses uploaded documents (PDFs, articles, videos) and helps users summarise, understand, and transform information into notes, mind maps, podcasts, or presentations.

| Key Strengths                                                                                                                                                                                                                                                                                                                                                           | Weaknesses / Limitations                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>• Works exclusively with user-uploaded documents, improving accuracy and reliability</li> <li>• Powerful summarisation and synthesis of large document volumes</li> <li>• Multiple output formats: podcasts, videos, diagrams, slides, flashcards</li> <li>• Integration with Google Docs, Drive, and Workspace tools</li> </ul> | <ul style="list-style-type: none"> <li>• Limited to provided sources — not suitable for open-ended exploration</li> <li>• Quality of results depends heavily on the quality of uploaded documents</li> <li>• Some features are still evolving and may change frequently</li> <li>• Advanced features require paid plans</li> </ul> |

### Technical Information

|                    |                                               |
|--------------------|-----------------------------------------------|
| <b>Integration</b> | LMS integration, API; requires Google Account |
| <b>Languages</b>   | Language of the connected Google account      |

### Suitability Assessment

*Ideal for knowledge workers, researchers, and L&D teams who need to rapidly distil and repurpose large volumes of existing documents into training materials. Less suited for frontline industrial training.*

## 10. AutoVRse

| Vendor / Developer | Country | Website                                                           | Last Update   |
|--------------------|---------|-------------------------------------------------------------------|---------------|
| AutoVRse           | India   | <a href="https://www.autovrse.com/">https://www.autovrse.com/</a> | Not specified |

**Tool Categories:** VR/AR Training

**Fields of Use:** Production | Maintenance | HSE

### Description

AutoVRse is an AI-enhanced VR training environment that provides digital simulations of manufacturing equipment for industrial skill development. It features adaptive analytics on trainee performance and high-fidelity simulations for technical tasks.

| Key Strengths                                                                                                                                                                                                                                                                                                                                                                  | Weaknesses / Limitations                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>High-fidelity simulations of industrial equipment for realistic skills training</li> <li>Adaptive analytics on individual trainee performance during simulations</li> <li>Supports xAPI for granular performance tracking back to LMS</li> <li>SSO support (SAML 2.0, Azure AD, Okta) and RESTful APIs for BI/HR integration</li> </ul> | <ul style="list-style-type: none"> <li>Factsheet details on weaknesses/limitations are underdeveloped</li> <li>Requires VR hardware investment</li> <li>Language support limited to English</li> <li>Limited information on pricing and support</li> </ul> |

### Technical Information

|                    |                                                                          |
|--------------------|--------------------------------------------------------------------------|
| <b>Integration</b> | xAPI (LRS/LMS integration), SSO (SAML 2.0, Azure AD, Okta), RESTful APIs |
| <b>Languages</b>   | EN                                                                       |

### Suitability Assessment

*Strong fit for manufacturing and industrial companies seeking immersive, data-driven VR safety and skills training. Particularly effective for assembly line, CNC operations, and safety procedure training.*

## 11. 3spin Learning

| Vendor / Developer           | Country | Website                                                                       | Last Update                               |
|------------------------------|---------|-------------------------------------------------------------------------------|-------------------------------------------|
| 3spin Learning GmbH & Co. KG | Germany | <a href="https://www.3spin-learning.com/">https://www.3spin-learning.com/</a> | December 2025<br>(updated every 4 months) |

**Tool Categories:** Content generation | Adaptive learning | Assessment / Feedback | VR/AR Training

**Fields of Use:** HR | HSE | Soft Skills

### Description

3spin Learning is a VR/AR training platform that combines immersive simulations with AI-powered interactivity. It enables organisations to create custom training scenarios for soft skills, customer service, and safety without coding, supporting VR headsets, desktops, and mobile devices.

| Key Strengths                                                                                                                                                                                                                                                                                                           | Weaknesses / Limitations                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>Immersive VR/AR simulations for realistic training scenarios</li><li>No-code content creation for rapid deployment across teams</li><li>AI-powered feedback and interactive role-play scenarios</li><li>Scalable for enterprise-level onboarding and skills development</li></ul> | <ul style="list-style-type: none"><li>Primarily focused on VR/AR — not a full LMS solution</li><li>Requires compatible hardware for the full immersive experience</li><li>Frequent updates may require content revisions</li><li>Limited adaptive learning features compared to dedicated AI learning platforms</li></ul> |

### Technical Information

|             |                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------|
| Integration | SSO and APIs for integration with existing LMS/LXP platforms; supports enterprise reporting and progress tracking |
| Languages   | Primarily English (EN)                                                                                            |

### Suitability Assessment

*Well-suited for enterprise HR and soft skills training where immersive, scenario-based VR experiences are desired. Complements, rather than replaces, a full LMS.*

## 12. Docebo

| Vendor / Developer | Country        | Website                                                       | Last Update |

| Docebo Inc.        | Italy / Canada | <a href="https://www.docebo.com/">https://www.docebo.com/</a> | March 2026  |

**Tool Categories:** Adaptive learning | Chatbot/Assistant | Analytics / Prediction | LMS/LXP with AI | AI-assisted learning paths

**Fields of Use:** HR | Quality | HSE | Soft Skills | IT | General eLearning

### Description

Docebo is an AI-powered LMS/LXP platform delivering personalised and adaptive learning experiences. Its AI engine recommends courses, generates learning paths, and provides predictive analytics on learner engagement and performance, with an AI assistant for student support and content navigation.

| Key Strengths                                                                                                                                                                                                                                                                                                                            | Weaknesses / Limitations                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>Adaptive learning with AI-driven course recommendations</li> <li>Predictive analytics and insights on learner engagement and performance</li> <li>AI assistant for guidance, support, and content discovery</li> <li>Comprehensive LMS/LXP functionality with SCORM/xAPI compatibility</li> </ul> | <ul style="list-style-type: none"> <li>Limited content generation compared to dedicated authoring tools like iSpring AI</li> <li>No native VR/AR training capabilities</li> <li>Automated assessment and feedback are partially AI-assisted but not fully autonomous</li> </ul> |

### Technical Information

|                    |                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------|
| <b>Integration</b> | SSO, SCORM/xAPI/Tin Can, APIs for HR systems, content libraries, and enterprise platforms |
| <b>Languages</b>   | EN, ES, IT, DE, SK, PT, FR, ZH, JA, and more                                              |

### Suitability Assessment

*A strong enterprise LMS choice for organisations prioritising adaptive, data-driven learning experiences with robust AI personalisation. Best suited to white-collar and knowledge-worker contexts.*

### 13. Virti

| Vendor / Developer | Country       | Website                                                     | Last Update   |
|--------------------|---------------|-------------------------------------------------------------|---------------|
| Virti              | Not specified | <a href="https://www.virti.com/">https://www.virti.com/</a> | Not specified |

**Tool Categories:** VR/AR Training | Assessment / Feedback

**Fields of Use:** Soft Skills | HSE

#### Description

Virti is an AI and simulation platform providing scenario-based training for operational and communication skills. It offers AI role-play simulations and provides automated feedback on learner performance, accessible via both VR headsets and desktop.

| Key Strengths                                                                                                                                                                                                                                                                                                               | Weaknesses / Limitations                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>AI-driven role-play simulations for soft skills and communication training</li> <li>Automated feedback on learner performance</li> <li>Accessible on desktop — does not require VR hardware for basic use</li> <li>Scenario-based approach supports experiential learning</li> </ul> | <ul style="list-style-type: none"> <li>Full immersive experience requires VR headsets</li> <li>Factsheet information is limited — detailed feature documentation unavailable</li> <li>Country of origin and update schedule not specified</li> <li>Language support limited to English</li> </ul> |

#### Technical Information

|                    |                                                                                   |
|--------------------|-----------------------------------------------------------------------------------|
| <b>Integration</b> | Designed for integration with HR reporting systems; automated feedback mechanisms |
| <b>Languages</b>   | EN                                                                                |

#### Suitability Assessment

*Suitable for organisations looking to develop soft skills, communication, and safety behaviours through engaging, AI-facilitated simulations. Works well alongside a broader LMS.*

## 14. Dataiku DSS

| Vendor / Developer | Country                 | Website                                                         | Last Update             |
|--------------------|-------------------------|-----------------------------------------------------------------|-------------------------|
| Dataiku            | USA (founded in France) | <a href="https://www.dataiku.com/">https://www.dataiku.com/</a> | Dataiku 14 (March 2026) |

**Tool Categories:** Chatbot/Assistant (AI Assistants & Agents) | Analytics / Prediction | LMS/LXP with AI (Dataiku Academy) | Enterprise AI Orchestration & Governance

**Fields of Use:** HR | Production | Maintenance | Quality | Soft Skills | IT | Marketing | Finance | Life Sciences | Retail

### Description

Dataiku DSS (Data Science Studio) is a centralised, collaborative platform for data professionals to design, deploy, and govern AI, machine learning, and analytics applications at scale. It includes an LLM Mesh for vendor-agnostic GenAI, robust governance (ISO 27001 certified), and the Dataiku Academy for internal learning.

| Key Strengths                                                                                                                                                                                                                                                                                                                                                        | Weaknesses / Limitations                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>End-to-end AI orchestration from data preparation to MLOps</li> <li>LLM Mesh for vendor-agnostic integration of multiple AI/LLM providers</li> <li>Robust built-in governance with ISO 27001 certification</li> <li>Broad departmental applicability: HR, production, maintenance, quality, IT, marketing, finance</li> </ul> | <ul style="list-style-type: none"> <li>High resource requirements (minimum 32 GB RAM for server; Linux x86-64)</li> <li>Complexity may require specialised training for staff</li> <li>Primarily suited to data teams — steep learning curve for non-technical users</li> </ul> |

### Technical Information

|                    |                                                                   |
|--------------------|-------------------------------------------------------------------|
| <b>Integration</b> | Python and REST APIs; AWS, Azure, GCP, Snowflake, Databricks      |
| <b>Languages</b>   | Interface primarily in EN; coding in Python, R, SQL, Scala, Julia |

### Suitability Assessment

*Best suited for large enterprises with dedicated data science teams seeking a unified AI governance and analytics platform. Not designed as a primary L&D or training tool, but powerful for organisations building AI-driven training analytics.*

## 15. Napkin AI

| Vendor / Developer | Country            | Website                                                     | Last Update   |
|--------------------|--------------------|-------------------------------------------------------------|---------------|
| Napkin             | US, France & India | <a href="https://www.napkin.ai/">https://www.napkin.ai/</a> | Not specified |

**Tool Categories:** Content generation | Adaptive learning

**Fields of Use:** Soft Skills | Marketing

### Description

Napkin AI is an AI-powered visual creation platform that transforms plain text into professional visuals such as diagrams, infographics, charts, mind maps, and flowcharts. Users paste text and Napkin generates corresponding graphics — no design skills or complex prompts required.

| Key Strengths                                                                                                                                                                                                                                                                                                                                                                                                                                               | Weaknesses / Limitations                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>No design experience or prompt engineering knowledge required</li> <li>Significant time savings — tasks that normally take hours completed in under a minute</li> <li>Wide variety of visual output types: flowcharts, concept maps, infographics, timelines</li> <li>API available for developers to integrate visual generation into external workflows</li> <li>Free plan available (with limitations)</li> </ul> | <ul style="list-style-type: none"> <li>Interface is only available in English</li> <li>Free plan has weekly credit limits (e.g., 500 weekly credits)</li> <li>No built-in mobile editing or offline mode</li> <li>Not a standalone training platform</li> </ul> |

### Technical Information

|                    |                                                           |
|--------------------|-----------------------------------------------------------|
| <b>Integration</b> | API available for external workflow integration           |
| <b>Languages</b>   | EN interface; content output can be in multiple languages |

### Suitability Assessment

*Excellent complementary tool for instructional designers and L&D teams needing to rapidly produce visual learning materials. Not a training platform itself, but highly effective for creating supporting visuals and training documentation.*

## Comparative Overview

The table below provides a high-level comparative overview of all 15 tools across key evaluation dimensions. This matrix is intended to support decision-makers in quickly identifying the tools most suitable for specific organisational needs and industrial training contexts.

| Tool Name       | Category                  | Adaptive Learning | VR/AR | Analytics | Integration | Languages                 | Industrial Suitability |
|-----------------|---------------------------|-------------------|-------|-----------|-------------|---------------------------|------------------------|
| TalentLMS       | LMS/LXP with AI           | Partial           | No    | Yes       | High        | 40+                       | Medium                 |
| TalentCards     | Mobile Microlearning      | No                | No    | Basic     | Medium      | 30+                       | High                   |
| iSpring AI      | Course Authoring          | No                | No    | No        | Medium      | 50+                       | Medium                 |
| AIDAR Solutions | VR/AR Training            | Partial           | Yes   | No        | IIoT        | EN/DE/PL                  | High                   |
| Uizard          | Design Training           | Partial           | No    | No        | Low         | Multi                     | Low                    |
| Disco           | LMS/LXP + Community       | Yes               | No    | Yes       | Medium      | EN+                       | Low                    |
| Augmentir       | Connected Worker Platform | Yes               | Yes   | Yes       | High        | N/S                       | Very High              |
| FlowHunt        | AI Workflow / Chatbot     | Yes               | No    | Limited   | Medium      | EN/SK/+                   | Medium                 |
| NotebookLM      | Research & Note-Taking AI | Partial           | No    | No        | Google      | Multi                     | Low                    |
| AutoVRse        | VR/AR Training            | Yes               | Yes   | Yes       | xAPI/API    | EN                        | Very High              |
| 3spin Learning  | VR/AR Training            | Partial           | Yes   | Partial   | Medium      | EN                        | High                   |
| Docebo          | LMS/LXP with AI           | Yes               | No    | Yes       | High        | Multi                     | Medium                 |
| Virti           | VR/AR + Assessment        | No                | Yes   | Partial   | HR Systems  | EN                        | Medium                 |
| Dataiku DSS     | AI/ML Orchestration       | No                | No    | Yes       | Very High   | EN                        | High (data teams)      |
| Napkin AI       | Visual Content Creation   | No                | No    | No        | API         | EN interface/Multi output | Low (support tool)     |

Notes: N/S = Not Specified. Industrial Suitability reflects the tool's appropriateness for frontline, manufacturing, maintenance, or safety training contexts specifically.

## Case Studies from Project Partners

To complement the tool-by-tool evaluation, project partners conducted structured interviews with organisations across five partner countries to document real-world examples of AI adoption in workplace learning and training. Each case study follows a consistent structure, presented in the same format used for the tool evaluations above: an overview table, company context, the AI solution implemented, outcomes and challenges, and key insights.

Case studies are presented by partner country: Spain (FVEM), Portugal (SPIN), Italy (SIAM), Austria (Room466), and Slovakia (SBA).

## Spain (FVEM)

### 1. Airlan SA

| Partner | Country | Company Size                   |
|---------|---------|--------------------------------|
| FVEM    | Spain   | ~85 employees (~€60M turnover) |

**Industry / Sector:** Manufacturing of HVAC Equipment

**Interviewee Position:** Industrial Engineer, Innovation Department

**Website:** <https://airlan.es>

#### Company Context

Airlan SA manufactures large-scale climate control equipment for tertiary clients such as offices, hospitals, and sports centres, and is expanding into preventative and predictive maintenance services. Its field service technicians install, commission, and repair complex HVAC machinery under strict warranty conditions, traditionally relying on dense technical manuals that were difficult to navigate under time pressure.

#### Situation Before Implementation

Legacy manuals were designed for marketing and visual layout rather than structured data retrieval, forcing technicians to manually search hundreds of pages for diagnostic codes and wiring diagrams. End-of-shift Work Orders were often brief and poorly phrased, making it very difficult to consolidate multi-month reporting on recurring asset failures or warranty claims.

#### AI Solution Implemented

Airlan introduced a dual-purpose generative AI solution: a technical manual chatbot that answers natural-language queries and displays the exact manual page number to prevent hallucinations, and a Work Order summariser that rewrites unstructured technician notes into professional, standardised multi-month client reports.

#### Implementation Process

The initiative was led internally by the R&D/Innovation department using a trial-and-error approach and professional Claude and ChatGPT licences, without a formal top-down AI roadmap. A key challenge was misalignment between R&D, which was building advanced prototypes, and the field Technical Services department, which was focused on daily operational emergencies. Legacy manual formats with heavy tables and visuals also made data ingestion technically difficult.

| Outcomes and Benefits                                                                                                                                                                                                                                                                                                                                                                                             | Challenges and Lessons Learned                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>Technicians save significant time on-site, using the chatbot as a real-time technical tutor.</li><li>Page-level citation maintains human verification while exploiting AI speed.</li><li>Administrative reporting that once took hours now takes seconds.</li><li>Parallel automation of invoice reading and ERP data entry delivered a quick administrative win.</li></ul> | <ul style="list-style-type: none"><li>AI development should follow operational pain points rather than be pushed from R&amp;D in isolation.</li><li>Senior technicians remain essential to supervise and validate AI outputs.</li><li>Legacy documentation must be restructured for AI readability before ingestion.</li></ul> |

#### Key Insights

- AI must act as a copilot, not the pilot — humans retain technical verification at all times.
- Citing the exact source page is essential to building trust in AI outputs in industrial settings.
- Quick administrative wins help build organisational confidence in AI before tackling more complex use cases.

## 2. We Are Clickers (WAK)

| Partner | Country | Company Size   |
|---------|---------|----------------|
| FVEM    | Spain   | ~20+ employees |

**Industry / Sector:** AI Solution Development / Digital Diagnostic Consultancy

**Interviewee Position:** AI Consultants (co-founders)

### Company Context

We Are Clickers (WAK) is an AI technology company and consultancy specialising in custom machine learning integrations and organisational diagnostics for industrial SMEs, with deep experience in the Basque metal sector helping traditional manufacturing workshops bridge outdated routines and Industry 4.0 capabilities.

### Situation Before Implementation

The Basque metal sector faces a looming generational crisis: senior technicians who can read a customer blueprint and manually derive precise manufacturing routings (gama operatoria) are retiring with no replacement pipeline. Their decades of informal, tacit know-how risk being lost, and static classroom courses are ineffective at capturing this kind of specialised expertise.

### AI Solution Implemented

WAK builds closed, restricted chatbots hosted on secure servers and trained exclusively on a company's internal databases, blueprint histories, diagnostic notes, and client specifications — rather than open public models. This 'digital brain' replicates a retiring expert's technical judgement, letting junior workers query it directly on the shop floor in real time.

### Implementation Process

WAK follows a phased methodology: consultants map every micro-process across departments over several months, prioritise use cases on an impact-vs-complexity matrix, and then embed a dedicated expert ('Clicker') on-site weekly or monthly to coach employees hands-on in writing precise prompts, rather than relying on classroom training.

| Outcomes and Benefits                                                                                                                                                                                                                                                                                                                                                                                                        | Challenges and Lessons Learned                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>• SMEs capture and digitise decades of technical machine criteria into a permanent corporate asset.</li> <li>• Junior workers gain an on-demand, judgement-free virtual tutor that accelerates onboarding.</li> <li>• Reduces the social pressure of asking basic questions on the shop floor.</li> <li>• Standardised routings help prevent recurring engineering errors.</li> </ul> | <ul style="list-style-type: none"> <li>• Automating a disorganised process only produces 'sophisticated chaos'.</li> <li>• Adoption faces a dual psychological barrier: operators fearing job loss, managers fearing skills exposure.</li> <li>• Success requires pairing digitally fluent younger staff with senior operational judgement.</li> </ul> |

### Key Insights

- Knowledge capitalisation — preserving retiring experts' tacit know-how — represents the highest-value use of AI for industrial SMEs.
- Never automate a broken process: internal workflows must be audited and stabilised first.
- Closed, secure AI deployments are essential to prevent 'Shadow AI' leakage of sensitive data.

### 3. Haizea Wind

| Partner | Country | Company Size                                |
|---------|---------|---------------------------------------------|
| FVEM    | Spain   | ~900 employees (grown from ~400 since 2023) |

**Industry / Sector:** Heavy Industrial Manufacturing (Offshore Wind Foundations & Towers)

**Interviewee Position:** Heads of Management Systems, Corporate Services/Innovation, and HR & Training

**Website:** <https://haizeawindgroup.com>

#### Company Context

Haizea Bilbao manufactures massive offshore wind towers and monopiles up to 105 metres long and 2,200 tonnes. Driven by the green transition, the company doubled its workforce between 2023 and 2026, with around 80% of staff working directly or indirectly on the shop floor. Training is extensive (13,000–18,000 hours annually) and managed in-company via a newly implemented SAP Training Module.

#### Situation Before Implementation

Employees had begun using public AI tools individually ('Shadow AI'), creating cybersecurity risks around client NDAs and proprietary manufacturing processes. Traditional 4–8 hour classroom training formats were incompatible with high-pressure shop floor routines, and a looming retirement wave among senior welding and manufacturing technicians threatened to erase decades of undocumented expertise.

#### AI Solution Implemented

Haizea deployed NotebookLM, licensed for HR and Training/Production, to convert dense technical manuals and compliance documents into short microlearning 'pills' such as interactive audio podcasts and video guides with embedded questions. In parallel, the company is preparing lightweight, local, offline AI models (the 'Volkswagen Golf' approach) to protect proprietary industrial designs and avoid public cloud vulnerabilities.

#### Implementation Process

Implementation combined top-down and bottom-up elements: 8-hour AI awareness courses for directors (via SPRI) established governance and leadership alignment, while an initial grassroots 'AI Forum' of tech-savvy younger employees proved useful for testing but lacked the operational seniority to identify high-value use cases. Haizea therefore shifted to a 'Senior Champions' model, training respected senior leads to drive adoption within their own teams.

| Outcomes and Benefits | Challenges and Lessons Learned |
|-----------------------|--------------------------------|
|-----------------------|--------------------------------|

- |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>• Shop floor operators can ask basic technical questions to a virtual tutor without social discomfort.</li><li>• Converting dense PDFs into audio/video pills saved substantial content-development time.</li><li>• Senior Champions redirected AI use toward operational automation and knowledge preservation.</li><li>• Planned local server deployment aims to keep competitive engineering data fully secure.</li></ul> | <ul style="list-style-type: none"><li>• Large, expensive public cloud models are not necessary for industrial tasks.</li><li>• Younger employees bring digital agility, but senior experts provide essential operational judgement.</li><li>• As with other cases, disorganised processes must be audited and stabilised before AI is introduced.</li></ul> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Key Insights

- Knowledge preservation ahead of retirement waves is the highest-value AI use case in heavy industry.
- IP-sensitive industrial sectors should plan for local/offline AI deployment rather than public cloud alone.
- Pairing junior digital agility with senior operational judgement ('Senior Champions') outperforms either group alone.
- Training must adapt to the physical reality of shop floor operators — microlearning, audio, and video outperform static text.

## Portugal (SPIN)

### 4. Adidas GBS Porto

| Partner | Country  | Company Size        |
|---------|----------|---------------------|
| SPIN    | Portugal | 500–1,000 employees |

**Industry / Sector:** Corporate Services / Shared Services

**Interviewee Position:** Specialist, GBS HR Services

**Website:** <https://careers.adidas-group.com/locations/hubs/porto>

#### Company Context

Adidas GBS Porto is a shared-services hub supporting Adidas's European and Latin American operations. The interviewee works in HR Services, handling structure changes and reporting-line adjustments through SAP SuccessFactors — a corporate, office-based function handling highly sensitive employee and organisational data.

#### Situation Before Implementation

HR Services faced routine, time-consuming administrative burdens (emails, meeting minutes, information search, Excel automation), while uncontrolled use of public AI tools posed real data-protection risks given the sensitivity of SAP SuccessFactors data. Existing mandatory training covered cybersecurity and compliance well, but there was no structured, approved pathway for generative AI use.

#### AI Solution Implemented

Adidas authorised Microsoft Copilot, with tiered access, as the single officially sanctioned AI tool company-wide, and the HR team subsequently built an internal Copilot-based chatbot serving as a centralised knowledge repository for internal process questions.

#### Implementation Process

Rollout was centralised and top-down: company-wide communication announced Copilot as the approved tool, with guidance cascaded through team managers roughly 1.5–2 years before the interview. The internal chatbot was a subsequent, more targeted build on top of this foundation. Technical support from internal specialists mattered more than financial investment alone.

| Outcomes and Benefits                                                                                                                                                                                                                                                                                                                                  | Challenges and Lessons Learned                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>Faster drafting of emails and meeting minutes.</li> <li>Automation of repetitive Excel tasks via AI-generated VBA code.</li> <li>Internal chatbot lets employees self-serve process answers.</li> <li>Gains are moderate rather than transformative — improvement at the margins, not a step-change.</li> </ul> | <ul style="list-style-type: none"> <li>Data privacy significantly restricted how much AI could be applied to core HR processes.</li> <li>AI-specific training lagged behind other mandatory compliance programmes.</li> <li>Risk of over-reliance eroding independent writing and critical-thinking skills.</li> <li>AI's environmental footprint must be weighed against sustainability commitments.</li> </ul> |

#### Key Insights

- A governance-first approach — centrally authorising a single AI tool with tiered access — works well for sensitive-data functions.

- Internal chatbots can turn a personal productivity tool into shared organisational knowledge infrastructure.
- AI-specific training needs the same institutional rigour as other mandatory compliance programmes.

## 5. Unloop

| Partner | Country  | Company Size |
|---------|----------|--------------|
| SPIN    | Portugal | 8 employees  |

**Industry / Sector:** Creative / Design Agency

**Interviewee Position:** CEO

**Website:** <https://www.unloop.pt/>

### Company Context

Unloop is a small creative studio producing branding, content, presentations, and image/video/3D work for client projects. AI skill-building is informal, driven by individual curiosity, with no formal AI training plan in place.

### Situation Before Implementation

Client expectations for near-instant, high-quality output, combined with growing competition from lower-cost international 3D production markets, put pressure on the studio to speed up labour-intensive tasks such as background removal, prototyping, and drafting, in order to redirect effort toward storytelling and creative differentiation.

### AI Solution Implemented

Unloop integrated a portfolio of tools — ChatGPT, Microsoft Copilot, Google Gemini, Midjourney, and AI-assisted video/3D tools — directly into its production pipeline, using Copilot as an 'idea organiser' for client proposals and generative tools for image/video creation and rapid prototyping. A strict human-in-the-loop policy treats AI output only as a starting point, always manually revised to preserve the studio's creative voice.

### Implementation Process

Adoption was organic and bottom-up rather than a planned rollout: staff experimented individually with what worked for their tasks, and the CEO set a cultural stance encouraging AI use while preserving human revision and independent skill. There was no dedicated training budget for AI specifically.

| Outcomes and Benefits                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Challenges and Lessons Learned                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>• Reduced time on repetitive production tasks, freeing staff for higher-value creative work.</li> <li>• AI lets non-specialist staff execute image/video tasks that previously required dedicated expertise.</li> <li>• Rapid prototyping accelerated both creative concepts and client-facing documents.</li> <li>• Faster production also compressed reflection time and raised client expectations for instant delivery.</li> </ul> | <ul style="list-style-type: none"> <li>• High subscription costs for multiple AI tools.</li> <li>• AI-generated outputs were sometimes hard to modify once created.</li> <li>• A temporary ChatGPT outage exposed how dependent daily work had become on AI.</li> <li>• Advanced, genuinely relevant training is hard to find given how quickly tools evolve.</li> </ul> |

## Key Insights

- AI adoption can be a competitive necessity as much as an efficiency choice.
- 'AI as first draft, human as final voice' protects creative identity and differentiation.
- Using different AI tools per project, rather than standardising on one, better matches tool strengths to needs.

## Italy (SIAV)

### 6. Carraro Group

| Partner | Country | Company Size                                 |
|---------|---------|----------------------------------------------|
| SIAV    | Italy   | ~3,800 employees worldwide (~1,660 in Italy) |

**Industry / Sector:** Manufacturing / Engineering (Driveline Systems, Off-Highway Vehicles)

**Interviewee Position:** Learning Development Manager

**Website:** <http://carraro.com>

#### Company Context

Carraro is an Italian multinational engineering and manufacturing group developing driveline systems and specialised tractors for agriculture and construction, with global 'local-for-local' production. Training is coordinated through its corporate Academy (DriveUp) via blended learning, and the company is adopting a new LMS (Workday) to support more personalised learning paths.

#### Situation Before Implementation

Carraro faced a reluctant mindset toward AI adoption and change more broadly. To build a shared baseline of digital competencies, the company launched pilot microlearning programmes in AI, cybersecurity, and data analytics following an initial digital-maturity survey, while also needing to protect company know-how, ensure ethical AI use, and continuously update policy guidelines.

#### AI Solution Implemented

AI is currently used mainly to create digital training content, including videos and microlearning modules developed with AI-generated avatars, combined with on-the-job shadowing and in-person training. Future plans include AI-powered personalisation of learning pathways and adaptive learning experiences.

#### Implementation Process

The rollout of a new LMS (Workday) will enable AI-supported personalisation based on employees' roles and career plans. Implementation spans HR, R&D, Finance, Controlling, and IT through dedicated working groups, with particular attention paid to helping People Managers build awareness of AI adoption within their units.

| Outcomes and Benefits                                                                                                                                                                                                                                                                     | Challenges and Lessons Learned                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>Reduced time and cost of training video production while maintaining quality.</li> <li>Improved accessibility to training resources and engagement levels.</li> <li>Further personalisation benefits expected as the new LMS rolls out.</li> </ul> | <ul style="list-style-type: none"> <li>Building a common digital-skills foundation before advanced AI applications is important.</li> <li>Supporting adoption through structured change management and early manager involvement.</li> <li>AI should complement, not replace, employees, with clear policies for secure and ethical use.</li> </ul> |

#### Key Insights

- AI adoption is best approached as a strategic cultural transformation, not solely a technological one.

- A shared baseline of digital competencies across the workforce is essential before scaling AI use.
- Engaging managers early is a critical success factor for organisation-wide adoption.

## 7. Nokia Italia

| Partner | Country | Company Size                     |
|---------|---------|----------------------------------|
| SIIV    | Italy   | ~1,200 employees (2026 estimate) |

**Industry / Sector:** Telecommunications

**Interviewee Position:** HR Generalist (People Organisation)

**Website:** <https://www.nokia.com>

### Company Context

Nokia Italia is the Italian subsidiary of Nokia, serving telecom operators, enterprises, government bodies, and cloud providers with mobile networks, network infrastructure, cloud/network software, R&D, and professional services. The workforce is predominantly STEM-qualified, and training is organised pyramidally with unit managers identifying strategic skills needs.

### Situation Before Implementation

AI became Nokia Italia's top strategic workforce-development competence area over the past two years, with AI-related goals formally included in individual performance objectives for the first time. Challenges included diverse AI literacy across employees, data security concerns, difficulty integrating AI outputs with legacy systems, and a lack of clear ROI metrics for AI-related training.

### AI Solution Implemented

Nokia deployed Microsoft Copilot for data analysis, forecasting, communication, and productivity; an internal Nokia GPT for secure enterprise use; a Corporate AI Chatbot for employee support; and a SharePoint-based AI Adoption Platform providing tutorials, prompt training, and adoption tracking. AI-assisted coding tools are planned.

### Implementation Process

Adoption started with pilot initiatives among selected groups before expanding company-wide, supported by an AI-adoption reward system to incentivise use. In-person training was deliberately maintained alongside AI tools, reflecting the belief that no AI can replace the value a teacher brings to the classroom.

| Outcomes and Benefits                                                                                                                                                                                                                                                                                                                                                     | Challenges and Lessons Learned                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>• Copilot and Nokia GPT used organisation-wide for analysis, forecasting, and content creation.</li> <li>• Dedicated AI adoption platform provides training materials and prompt-engineering guidance.</li> <li>• Training combines AI-enabled resources with classroom sessions, coaching, and collaborative learning.</li> </ul> | <ul style="list-style-type: none"> <li>• AI adoption is no longer optional and requires strong governance and clear guidelines.</li> <li>• Learning-by-doing is significantly more effective than purely theoretical training.</li> <li>• Human interaction and face-to-face learning remain essential even in highly digitalised environments.</li> </ul> |

### Key Insights

- AI adoption should be accompanied by strong governance, clear guidelines, and structured employee education.
- Involving employees and acting on their feedback helps prioritise the most valuable training content.
- In-person training retains value that AI cannot replace, particularly the role of the teacher.

## Austria (Room466)

### 8. WIFI Steiermark

| Partner | Country | Company Size                                                    |
|---------|---------|-----------------------------------------------------------------|
| Room466 | Austria | Large regional VET provider (part of the Austrian WIFI network) |

**Industry / Sector:** Vocational Education and Training (VET), Adult Education, Technical/Industrial Training

**Interviewee Position:** Team Leader, Technical Training Programmes; Head of Manufacturing Technology, Welding Technology and Trade Sector

#### Company Context

WIFI Steiermark is one of Austria's largest vocational and professional training providers, offering programmes from apprenticeship preparation to master-level certification. Training is traditionally delivered through face-to-face classroom teaching, workshops, and trainer-supported learning, with hands-on practice central to technical fields such as manufacturing and welding.

#### Situation Before Implementation

Learners were increasingly using external AI tools independently, uploading learning materials to generate summaries, podcasts, or alternative formats outside the training provider's control. WIFI recognised that digitalisation had often meant simply replacing printed materials with PDFs, rather than genuinely interactive, AI-supported learning.

#### AI Solution Implemented

WIFI is developing an AI-supported learning ecosystem in which AI accesses only verified, approved educational materials rather than unrestricted internet sources. Planned functionalities include AI-generated podcasts and summaries, automatic quiz generation, personalised learning support, AI-assisted exam preparation, and integration of tablets to move toward paperless workshops.

#### Implementation Process

The initiative is being developed collaboratively across WIFI Steiermark, WIFI Austria, and other regional WIFI organisations. A pilot project within the Master School for Metal Technology is replacing printed scripts with tablets and testing AI-supported learning workflows, supported by the organisation's broader 'AI Driving Licence' (KI-Führerschein) literacy initiative.

| Outcomes and Benefits                                                                                                                                                                                                                                                                                                                                                              | Challenges and Lessons Learned                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>Improved learning personalisation across audio, visual, and text formats.</li> <li>Better and faster access to knowledge through direct interaction with materials.</li> <li>Protection of educational quality through validated content.</li> <li>A stronger position for WIFI as an innovation leader in vocational education.</li> </ul> | <ul style="list-style-type: none"> <li>Coordinating across multiple regional organisations and aligning national standards with local needs.</li> <li>Ensuring trainer readiness and acceptance.</li> <li>Encouraging learners to adopt institutional AI solutions rather than personal accounts.</li> <li>Educational quality must remain the priority — AI should complement, not replace, trainer-led instruction.</li> </ul> |

## Key Insights

- Educational institutions should proactively shape how AI supports learning rather than react passively.
- AI-supported learning systems should be built on trusted, verified content rather than unrestricted public sources.
- Successful implementation requires educational quality, organisational readiness, and continuous adaptation.

## 9. Leading Steel Industry / Railway Systems Company

| Partner | Country | Company Size                                                   |
|---------|---------|----------------------------------------------------------------|
| Room466 | Austria | ~8,000 employees in the Railway Systems unit; 50,000+ globally |

**Industry / Sector:** Steel Industry / Railway Systems / Metal Engineering

**Interviewee Position:** People Development, Training & Leadership Development Manager; People Acquisition Specialist (Group HR)

### Company Context

This international industrial manufacturer operates in railway infrastructure and steel engineering across more than 60 locations worldwide, employing a highly specialised workforce of engineers, technicians, and production staff. Training combines e-learning, classroom sessions, workshops, and on-the-job learning, with a strong focus on knowledge retention given the difficulty of recruiting specialised talent in many regions.

### Situation Before Implementation

Developing e-learning courses, workshop concepts, assessments, and multilingual content was a largely manual process, often taking several days per item and requiring additional effort for translation and localisation across international locations — creating a need for more efficient, scalable content development.

### AI Solution Implemented

The company uses multiple AI-supported tools across the learning development lifecycle, including Microsoft Copilot, Articulate Rise 360 and Storyline 360, AI-supported translation and text-to-speech tools, AI-supported video generation, and internal AI-supported knowledge databases containing historical maintenance cases for technical troubleshooting.

### Implementation Process

Implementation was driven through internal experimentation, with initial users trained by external experts and software providers and supported by monthly exchange sessions. The organisation combined AI capabilities with strong instructional design processes and expert validation rather than replacing existing quality-assurance procedures.

| Outcomes and Benefits | Challenges and Lessons Learned |
|-----------------------|--------------------------------|
|-----------------------|--------------------------------|

- |                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>• Content development that once took days can often be completed in hours.</li><li>• Reduces repetitive work in course design, drafting, and translation.</li><li>• Multilingual content can be produced at scale.</li><li>• AI-supported knowledge databases improve access to organisational expertise and reduce its loss.</li></ul> | <ul style="list-style-type: none"><li>• AI-generated content always requires expert review, especially in technical environments.</li><li>• Developing effective prompting skills takes time.</li><li>• More advanced tools involve real technical complexity.</li><li>• Project owners sometimes need expectations managed regarding what AI can fully automate.</li></ul> |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Key Insights

- AI delivers the greatest value as a design assistant, not as a replacement for learning expertise.
- Human validation remains essential, especially for technical content where errors carry real consequences.
- Prompting competence is an emerging core skill for learning and development professionals.

## Slovakia (SBA)

### 10. ŠVEC GROUP

| Partner                | Country  | Company Size                            |
|------------------------|----------|-----------------------------------------|
| Slovak Business Agency | Slovakia | Approx. 495+ employees across the group |

**Industry / Sector:** Manufacturing / Mechanical Engineering (custom metalworking, incl. automotive supply)

**Interviewee Position:** HR Manager and HR Department Lead

**Website:** <https://svecgroup.sk/>

#### Company Context

ŠVEC GROUP is a Slovak mechanical engineering group with more than 30 years of experience, operating three production plants, together with a number of partner businesses. It offers a broad portfolio of custom manufacturing services, from simple sheet-metal parts to large machined assemblies and fully engineered production lines, with exposure to the automotive sector. The workforce is highly diverse, spanning production staff (e.g. welders), technical and administrative (THP) roles, and management. Training needs are identified bottom-up by line managers each year, certifications with expiry dates are tracked centrally, and training is delivered almost entirely through external providers, deliberately kept diverse rather than tied to a single partner.

#### Situation Before Implementation

Employee training relied entirely on external providers and traditional formats (in-person courses, webinars, online courses), with no internal AI-supported learning tool in place. Employees used everyday productivity tools (mainly Microsoft 365 with Copilot) informally to search for information, but this was not organised as a learning activity. The company observed low tolerance for long online sessions — attention drops sharply after three to four hours — and found it difficult to standardise a single specialised training track given how diversified the workforce is across technical fields.

#### AI Solution Implemented

ŠVEC GROUP does not operate a proprietary AI learning platform. It supports the use of common office AI features, particularly Microsoft 365 Copilot, which employees already use informally to search for information and speed up daily tasks — a lightweight, informal form of self-directed learning. Beyond Copilot, employees individually use general-purpose generative AI tools such as ChatGPT for translation tasks and NotebookLM for building presentations. No AI tool is currently applied to a defined training or learning process; adoption so far is informal and employee-driven.

#### Implementation Process

There has been no formal implementation project for AI in training to date. Adoption of Copilot, ChatGPT and NotebookLM has happened organically at the individual level rather than through a company-wide rollout led by IT or HR. The main constraint identified was less about technology availability and more about mindset and data security — employees need to feel a new tool is safe to use with customer and production data. Informal awareness sessions attracted only around 15 people, lower than expected. As a locally rooted group rather than a large corporate structure, change happens gradually through voluntary buy-in rather than top-down instruction.

| Outcomes and Benefits | Challenges and Lessons Learned |
|-----------------------|--------------------------------|
|-----------------------|--------------------------------|

- |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>• Employees using Copilot, ChatGPT and NotebookLM report meaningful time savings — one interviewee cited productivity gains of around 20% for staff using AI tools multiple times a day.</li> <li>• AI tools are useful for more complex translation work and for building presentations.</li> <li>• As a structured, company-wide training capability, AI-supported learning has not yet been formally introduced, so organisation-wide outcomes cannot yet be assessed.</li> </ul> | <ul style="list-style-type: none"> <li>• The main challenge is a 'mindset' barrier — broadening genuine engagement beyond a small enthusiast group.</li> <li>• Data security and governance concerns limit how freely employees experiment with external AI tools on customer or production data.</li> <li>• Workforce diversity across many technical specialisations makes a single, unified technical training library difficult to build.</li> <li>• Long, unsupervised online sessions at an employee's regular desk have low retention; shorter or blended formats are preferred.</li> </ul> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Key Insights

- Everyday AI copilots (Microsoft 365 Copilot, ChatGPT, NotebookLM) already deliver informal learning and productivity benefits without a dedicated corporate AI training platform.
- Attention and format matter as much as content — shorter, better-structured or blended formats outperform long unsupervised online sessions.
- Broadening genuine employee engagement with AI is a bigger barrier than technology availability.
- A shared AI learning platform is likely to add the most value for broad, cross-cutting skills (e.g. communication, assertiveness) rather than deep, role-specific technical training.

## 11. Wienerberger Slovakia

| Partner                | Country  | Company Size                                                                                                    |
|------------------------|----------|-----------------------------------------------------------------------------------------------------------------|
| Slovak Business Agency | Slovakia | Large enterprise; part of the international Wienerberger Group (c. 34 years in Slovakia, two production plants) |

**Industry / Sector:** Building Materials Manufacturing (bricks, roof tiles, paving, and pipe systems)

**Interviewee Position:** Sales Manager (sales support, marketing, product management, SAP SD/MM and CRM system administration)

**Website:** <https://www.wienerberger.sk/>

### Company Context

Wienerberger is a global manufacturer of building materials that has operated in Slovakia for around 34 years as part of a group with more than 200 years of history. The workforce spans commercial, marketing, product management, and technical/administrative functions. Training and development is formally owned by HR, supplemented by team-level planning from managers. Training runs partly through an internal, group-wide e-learning system provided by the corporate parent, hosting instructional videos and tests with automatic completion tracking. AI adoption is driven centrally: Microsoft 365 Copilot has already been rolled out to every employee account.

### Situation Before Implementation

Before Copilot was introduced around 2 to 2.5 years ago, daily work — drafting emails, structuring communications, preparing project and approval documents, and writing tickets for developers — was done manually, in some cases in a non-native language (English), adding extra time and friction. Training already used a structured internal e-learning system with videos, tests, and

completion tracking, but it was not AI-powered, and general-purpose AI tools were only just beginning to be evaluated for controlled, centrally approved rollout.

## AI Solution Implemented

The primary AI tool in use is Microsoft 365 Copilot, licensed for every employee account and rolled out top-down from Group headquarters following a formal security-approval process. The interviewee uses Copilot for drafting and structuring emails, preparing project and approval documentation, and generating structured English-language developer tickets from short Slovak-language prompts, cutting translation and formatting time significantly. Copilot is not yet integrated with internal data sources such as SAP or CRM — that integration is the next stage the company is working towards. The interviewee also personally uses ChatGPT and Gemini for everyday, lower-stakes tasks.

## Implementation Process

The Copilot rollout was led by corporate IT at group headquarters level, including a formal security/approval process, before being made available locally. Day-to-day adoption is driven by individual employees and managers, with the interviewee actively encouraging their team to use Copilot more. A key technique developed independently was setting up separate, topic-specific Copilot channels (e.g. one dedicated channel for generating developer tickets), since mixing topics in a single conversation led to confused or lower-quality responses. Full integration with internal systems (SAP, CRM, customer portals) remains a separate, larger project requiring further central IT and security sign-off.

| Outcomes and Benefits                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Challenges and Lessons Learned                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Key Insights

- A centrally governed, top-down AI rollout can coexist with strong grassroots, employee-driven use cases at the local level.
- Precise, topic-scoped prompting materially improves AI output quality.
- The clearest productivity win so far has been AI-assisted drafting and translation of documentation and developer tickets.
- Deeper integration of AI copilots with core business systems is seen as the source of the largest future productivity gains, pending central IT and security clearance.
- Employees adopt AI tools fastest when they visibly and directly reduce daily friction and manual effort.

## Conclusions & Recommendations

---

Based on the analysis presented in this report, the following recommendations are offered to guide the selection and deployment of AI tools within the Learning Brains project and for industrial on-the-job training more broadly.

### For Industrial & Frontline Training

Augmentir is the strongest all-in-one solution for manufacturing, maintenance, and field service environments. Its AI-native connected worker platform covers the full lifecycle from onboarding to continuous improvement and integrates seamlessly with enterprise systems.

AutoVRse and AIDAR Solutions are recommended for organisations seeking high-fidelity VR simulation of industrial equipment and safety procedures. Both are hardware-agnostic or broadly compatible, and support xAPI/IIoT integration.

### For General Corporate Training

TalentLMS and Docebo are the recommended LMS platforms for organisations seeking scalable, AI-enhanced course delivery. TalentLMS offers the lower barrier to entry, while Docebo provides deeper adaptive learning and predictive analytics capabilities for larger enterprises.

TalentCards complements either LMS with mobile microlearning for deskless workers, particularly for compliance, onboarding, and safety briefings.

### For Content Creation & Supporting Tools

iSpring AI is recommended for L&D teams that need to rapidly produce multilingual eLearning content, particularly where PowerPoint-based workflows are already in use.

Napkin AI and NotebookLM are strong supplementary tools for instructional designers: Napkin AI for rapid visual content creation, and NotebookLM for synthesising and repurposing existing document libraries into training materials.

FlowHunt is recommended for organisations seeking to build internal AI knowledge bases and training chatbots without significant development investment, particularly relevant for knowledge management in complex industrial environments.

*The Learning Brains project will continue to pilot selected tools across partner organisations, with further evaluation reports to follow. Partners are encouraged to consider tool combinations rather than single solutions, as the most effective on-the-job training ecosystems typically combine an LMS or LXP with specialised content creation, immersive simulation, and mobile delivery tools.*
